

# Magnetized Gas Clouds in the Galactic Center

Mike McCourt, Ryan O'Leary,  
Ann-Marie Madigan, & Eliot Quataert

## “Gas Clouds in the Galactic Center”

### Dynamics of Magnetized Clouds

- \* Disruption *(McCourt, O’Leary, Madigan, & Quataert)*
- \* Acceleration

### Making Gas Clouds Work for Us

- \* G2’s twisted sister *(McCourt & Madigan, in prep.)*
- \* Using G2 to probe the accretion flow

*Dynamics of  
Magnetized Gas Clouds  
in Dilute Plasmas*

# Background

“Cloud Crushing:”

$$t_{\text{crush}} \sim \left( \frac{\rho_{\text{cloud}}}{\rho_{\text{wind}}} \right)^{1/2} \frac{R_{\text{cloud}}}{v_{\text{wind}}}$$

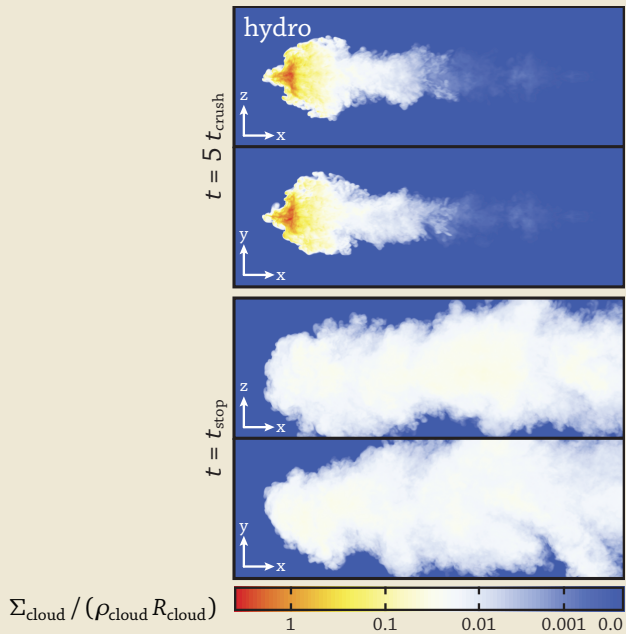

$t = 5 t_{\text{crush}}$

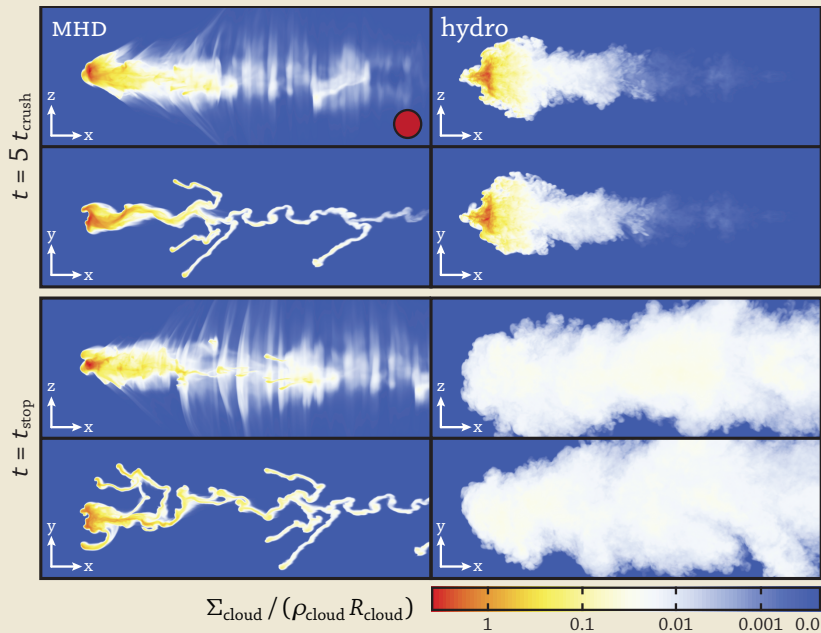

$t = t_{\text{stop}}$

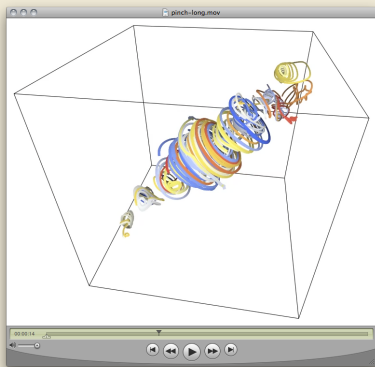

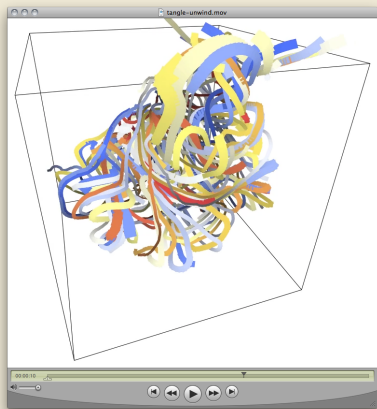

$\Sigma_{\text{cloud}} / (\rho_{\text{cloud}} R_{\text{cloud}})$

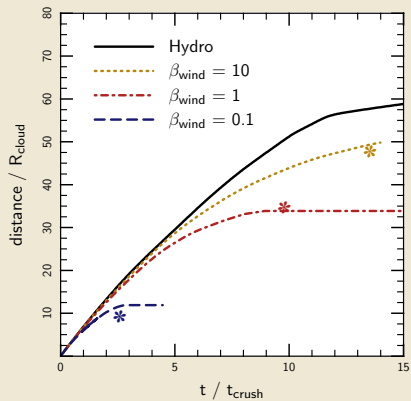

*aside:* initial conditions matter

# Magnetically-Enhanced Drag Force

$$R_{\text{curv}} \sim \frac{R_{\text{cloud}}}{\beta M^2}$$

*Putting Gas Clouds to Work:  
Probing the Galactic Center  
Accretion Flow*

*“Sometimes a man wants to be stupid if it lets him do a thing his cleverness forbids.”*

*— John Steinbeck*

*“Sometimes a man wants to be stupid if it lets him do a thing his cleverness forbids.”*

*— John Steinbeck*

- \* Assume G1 and G2 are gas clouds,
- \* Assume they follow the same trajectory
- \* Assume they survive at least one pericenter passage

## A (too-)Simple Model

$$\begin{aligned} \frac{d^2 \vec{r}}{dt^2} = & -\frac{GM_{\bullet} \vec{r}}{r^3} \\ & - \frac{\rho_{\text{bg}}(\vec{r})}{M_{\text{cloud}}} \times \left( 1 + \frac{2}{\beta M^2} \right) \\ & \times C^{-1} \cdot \text{diag} \left( R_{\text{cloud}}^2, R_{\text{cloud}} L_{\text{cloud}}, R_{\text{cloud}} L_{\text{cloud}} \right) \cdot (C \cdot \vec{v}_{\text{rel}})^2 \end{aligned}$$

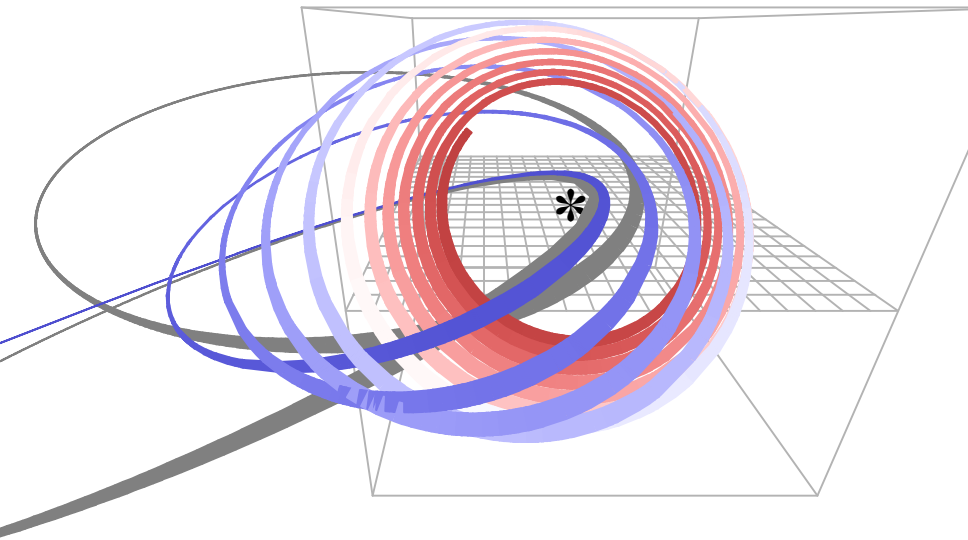

$$\rho_{\text{bg}}(\vec{r}) = \rho_0 \left( \frac{r}{r_0} \right)^{-\alpha}$$

$$T_{\text{bg}}(\vec{r}) = \frac{GM_{\bullet}}{r}$$

$$\vec{v}_{\text{bg}}(\vec{r}) = f_{\text{kep}} \left( \frac{GM_{\bullet}}{r} \right)^{1/2} \frac{\vec{J} \times \vec{r}}{J r}$$

# Future Evolution of G1 and G2

a testable prediction?

# Summary

## Magnetized Clouds

- \* Tangled magnetic fields *internal* to the clouds can inhibit disruption by shear instabilities.
- \* Magnetic fields *external* to the cloud can enhance the drag force, strongly coupling clouds to their environment.
- \* Depends on the internal structure of clouds; need to know how they formed to predict future evolution.

## Accretion Flow

- \* Given enough assumptions, G1 and G2 can be used to constrain properties of the accretion flow in the galactic center.
- \* If it works, only constraint at intermediate radii.
- \* Find an orientation for the rotation axis consistent with EHT determinations at smaller scales.
- \* Please keep following G1!
