Determining the Kepler false positive rate

- Kepler False Positive Rate (FPR) $< 10\%$ (Morton and Johnson 2011)

Determining the Kepler false positive rate

Kepler False Positive Rate (FPR) <10% (Morton and Johnson 2011)

Our project: determining the FPR **observationally**

- Selected a sample of candidates (34)
- Observed their transit with Spitzer (800h)
- Derive a False Positive Probability (FPP) for each object

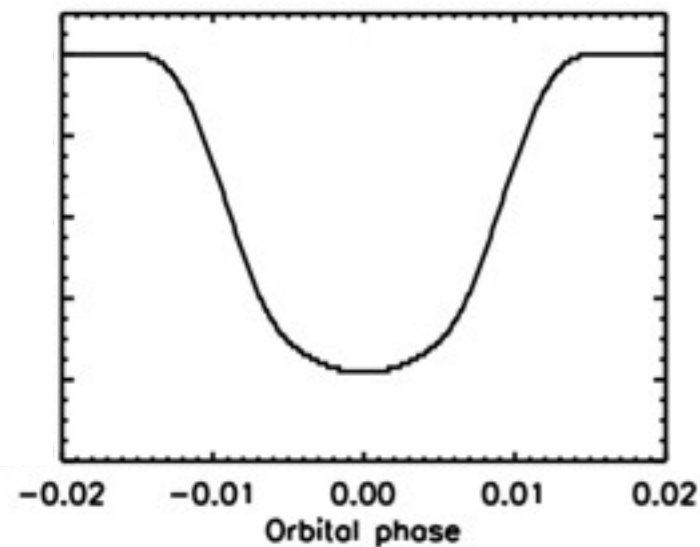

Validating planetary candidates

- No dynamical **confirmation** for most of the candidates (current radial velocity capabilities or TTVs)
- **Validation** of candidates by testing and ruling out false positive scenarios

Astrophysical False positives

- Sources that could mimic a planetary transit light curve :

Planet

EB

Astrophysical False positives

- Sources that could mimic a planetary transit light curve :
 - ✓ Blended background/foreground eclipsing binaries
 - ✓ Hierarchical triples

Planet

EB

Spitzer tests false positive scenarios

- A planetary transit depth is **achromatic**, a blend is not

Spitzer tests false positive scenarios

- A planetary transit depth is **achromatic**, a blend is not

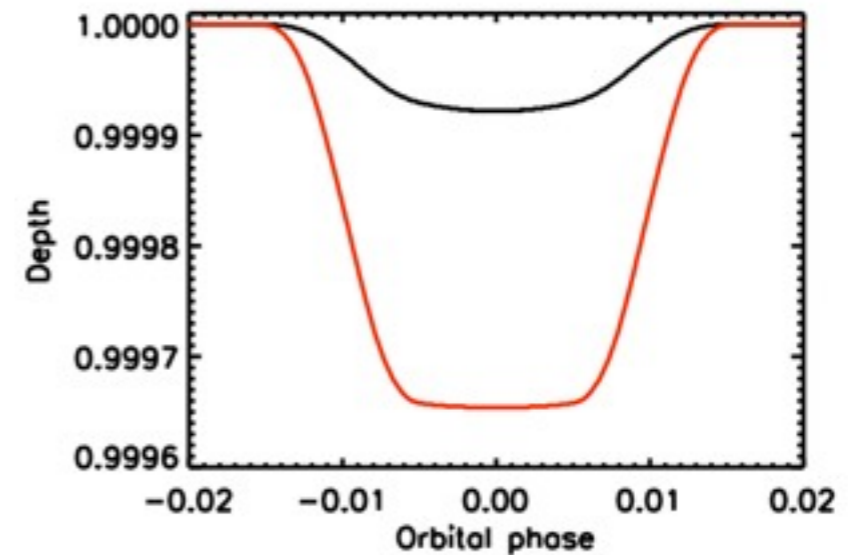

Kepler

Spitzer tests false positive scenarios

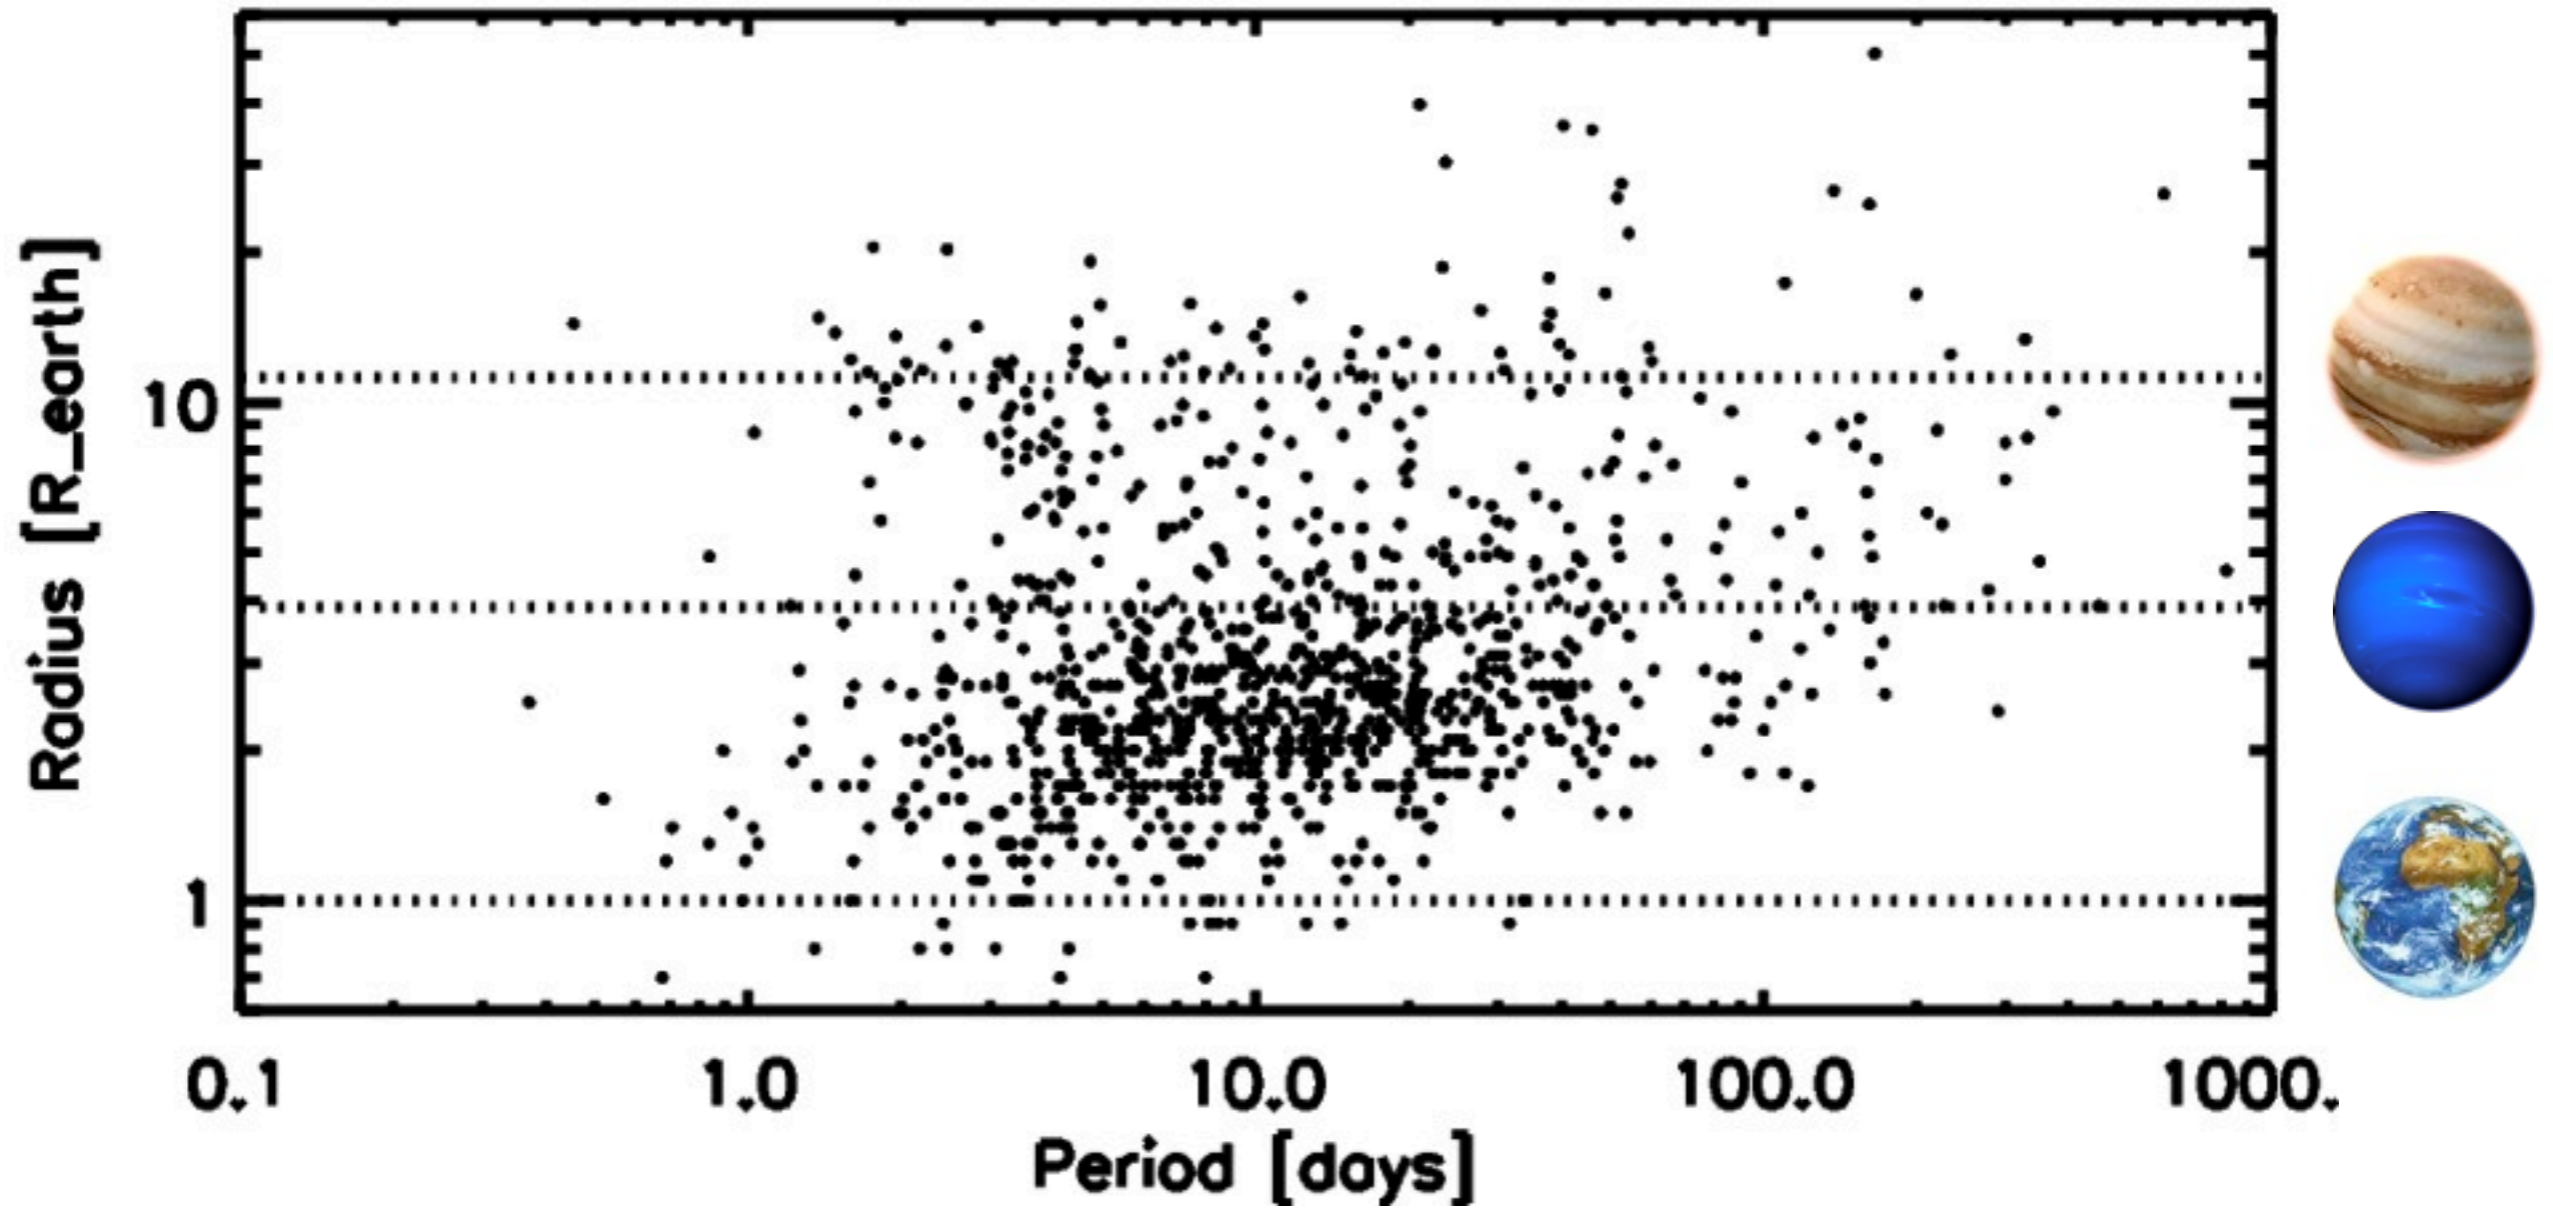

- A planetary transit depth is **achromatic**, a blend is not

Kepler depths

Kepler vs Spitzer depths

False Positive Probability (FPP)

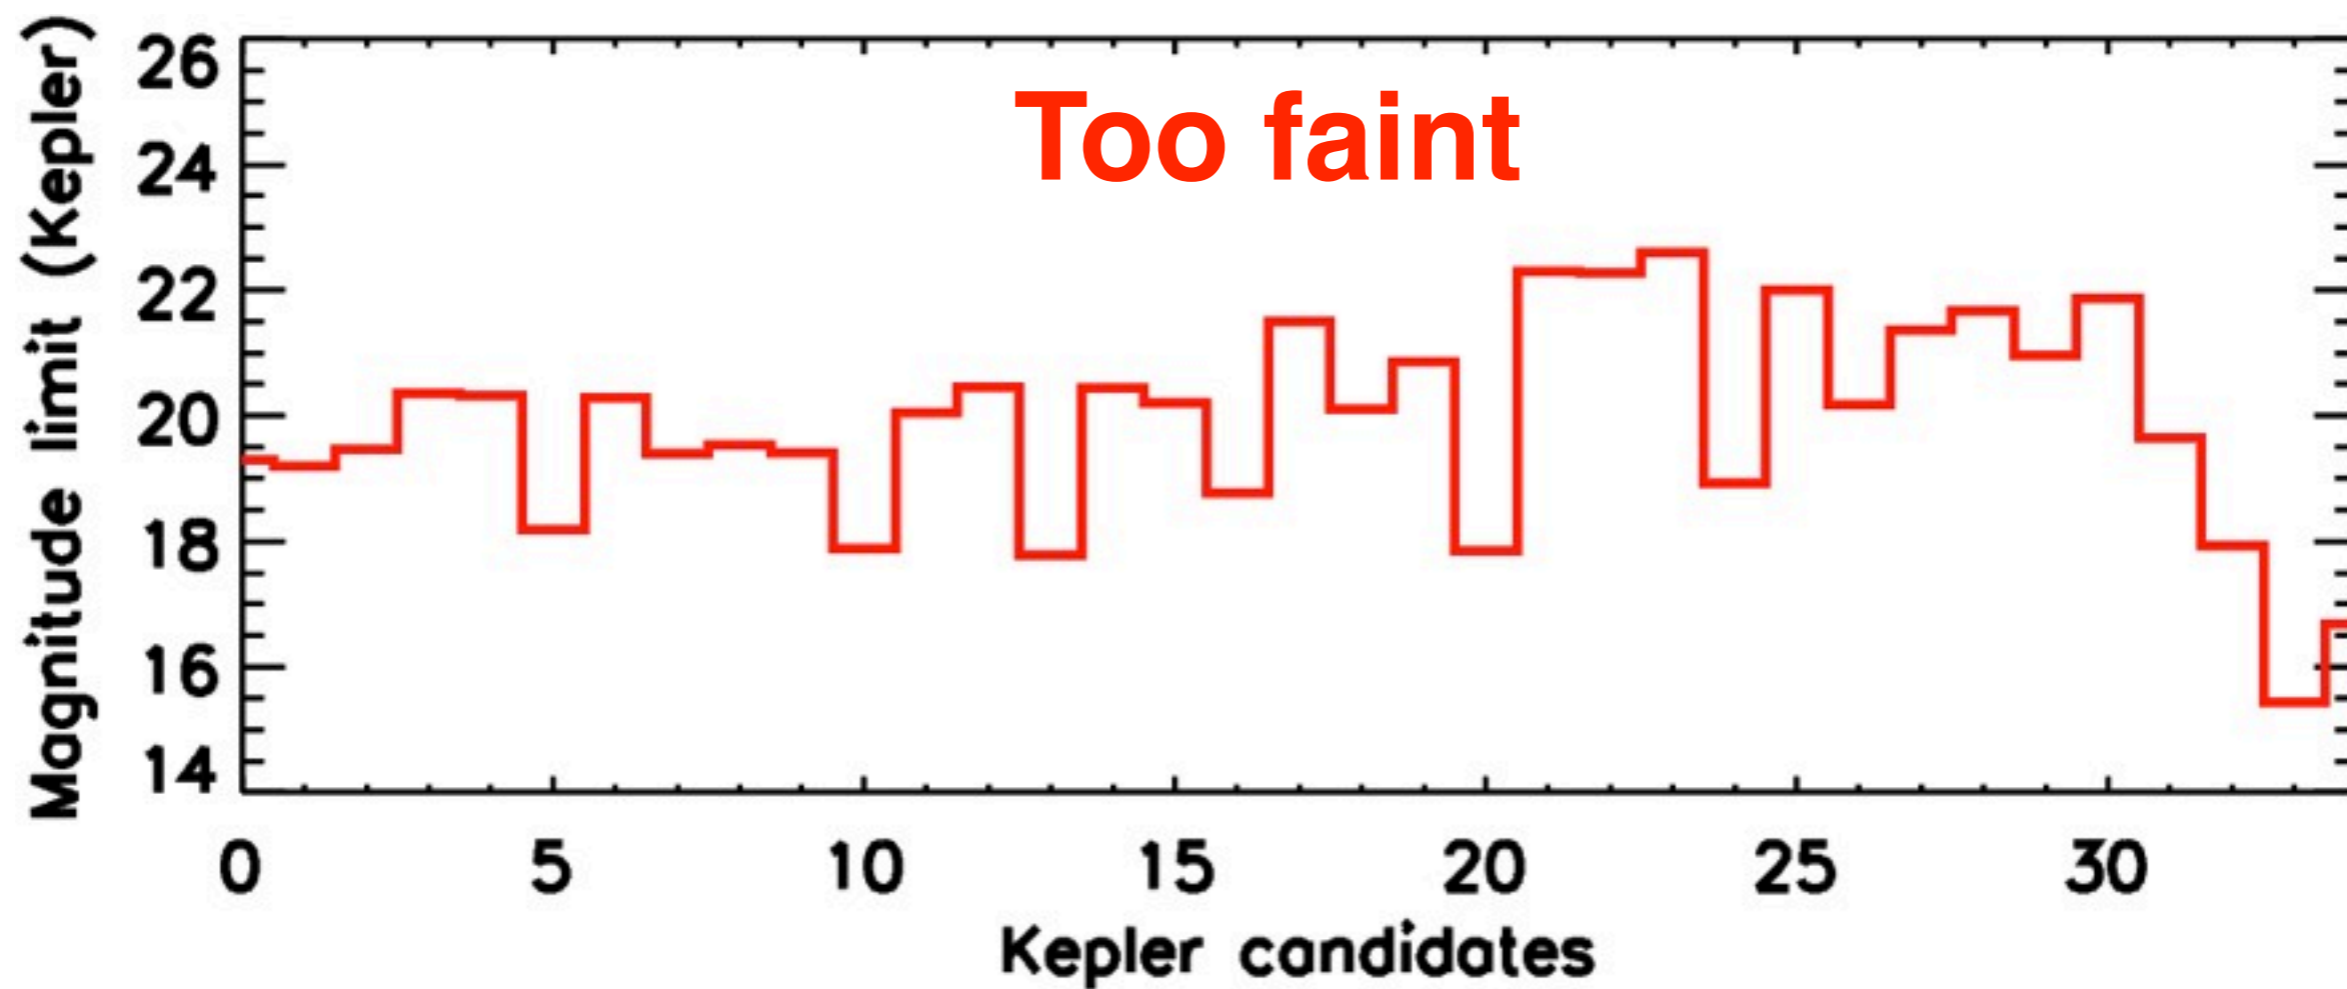

Framework

- Stellar characterization (spectroscopy)
- Local sky density
 - Stellar population synthesis (Besançon)
 - Kepler (photometry)
 - Centroid analysis (Kepler), Imaging (Adaptive optics, Speckle, ...)
 - **Spitzer** observations
- Blend frequencies + planet priors => FPP

Kepler depths

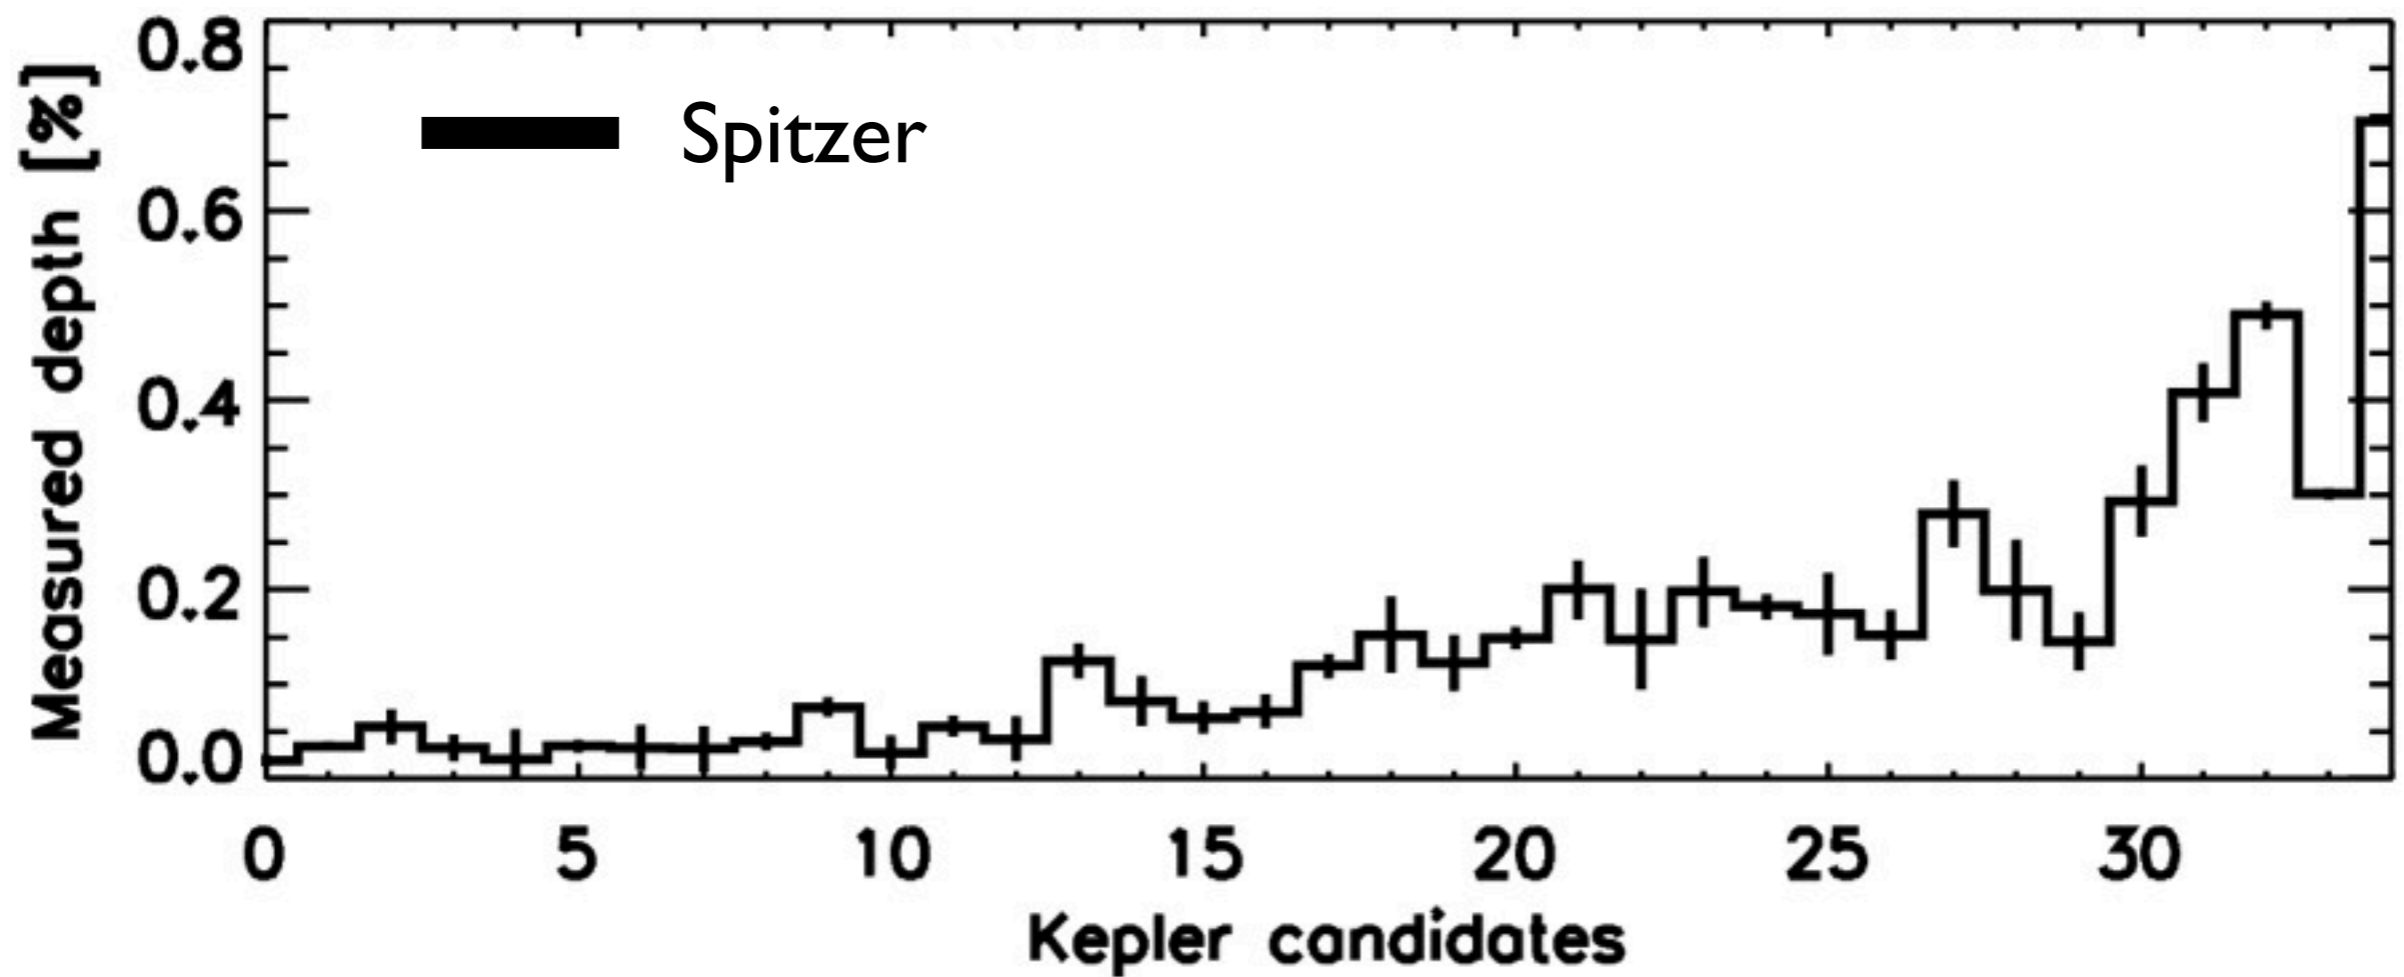

Faint limit condition

Framework

- Stellar characterization (spectroscopy)
- Local sky density
 - Stellar population synthesis (Besançon)
 - Kepler (photometry)
 - Centroid analysis (Kepler), Imaging (Adaptive optics, Speckle, ...)
 - **Spitzer** observations (depths and magnitudes)
- Compute blend frequencies + planet priors => FPP

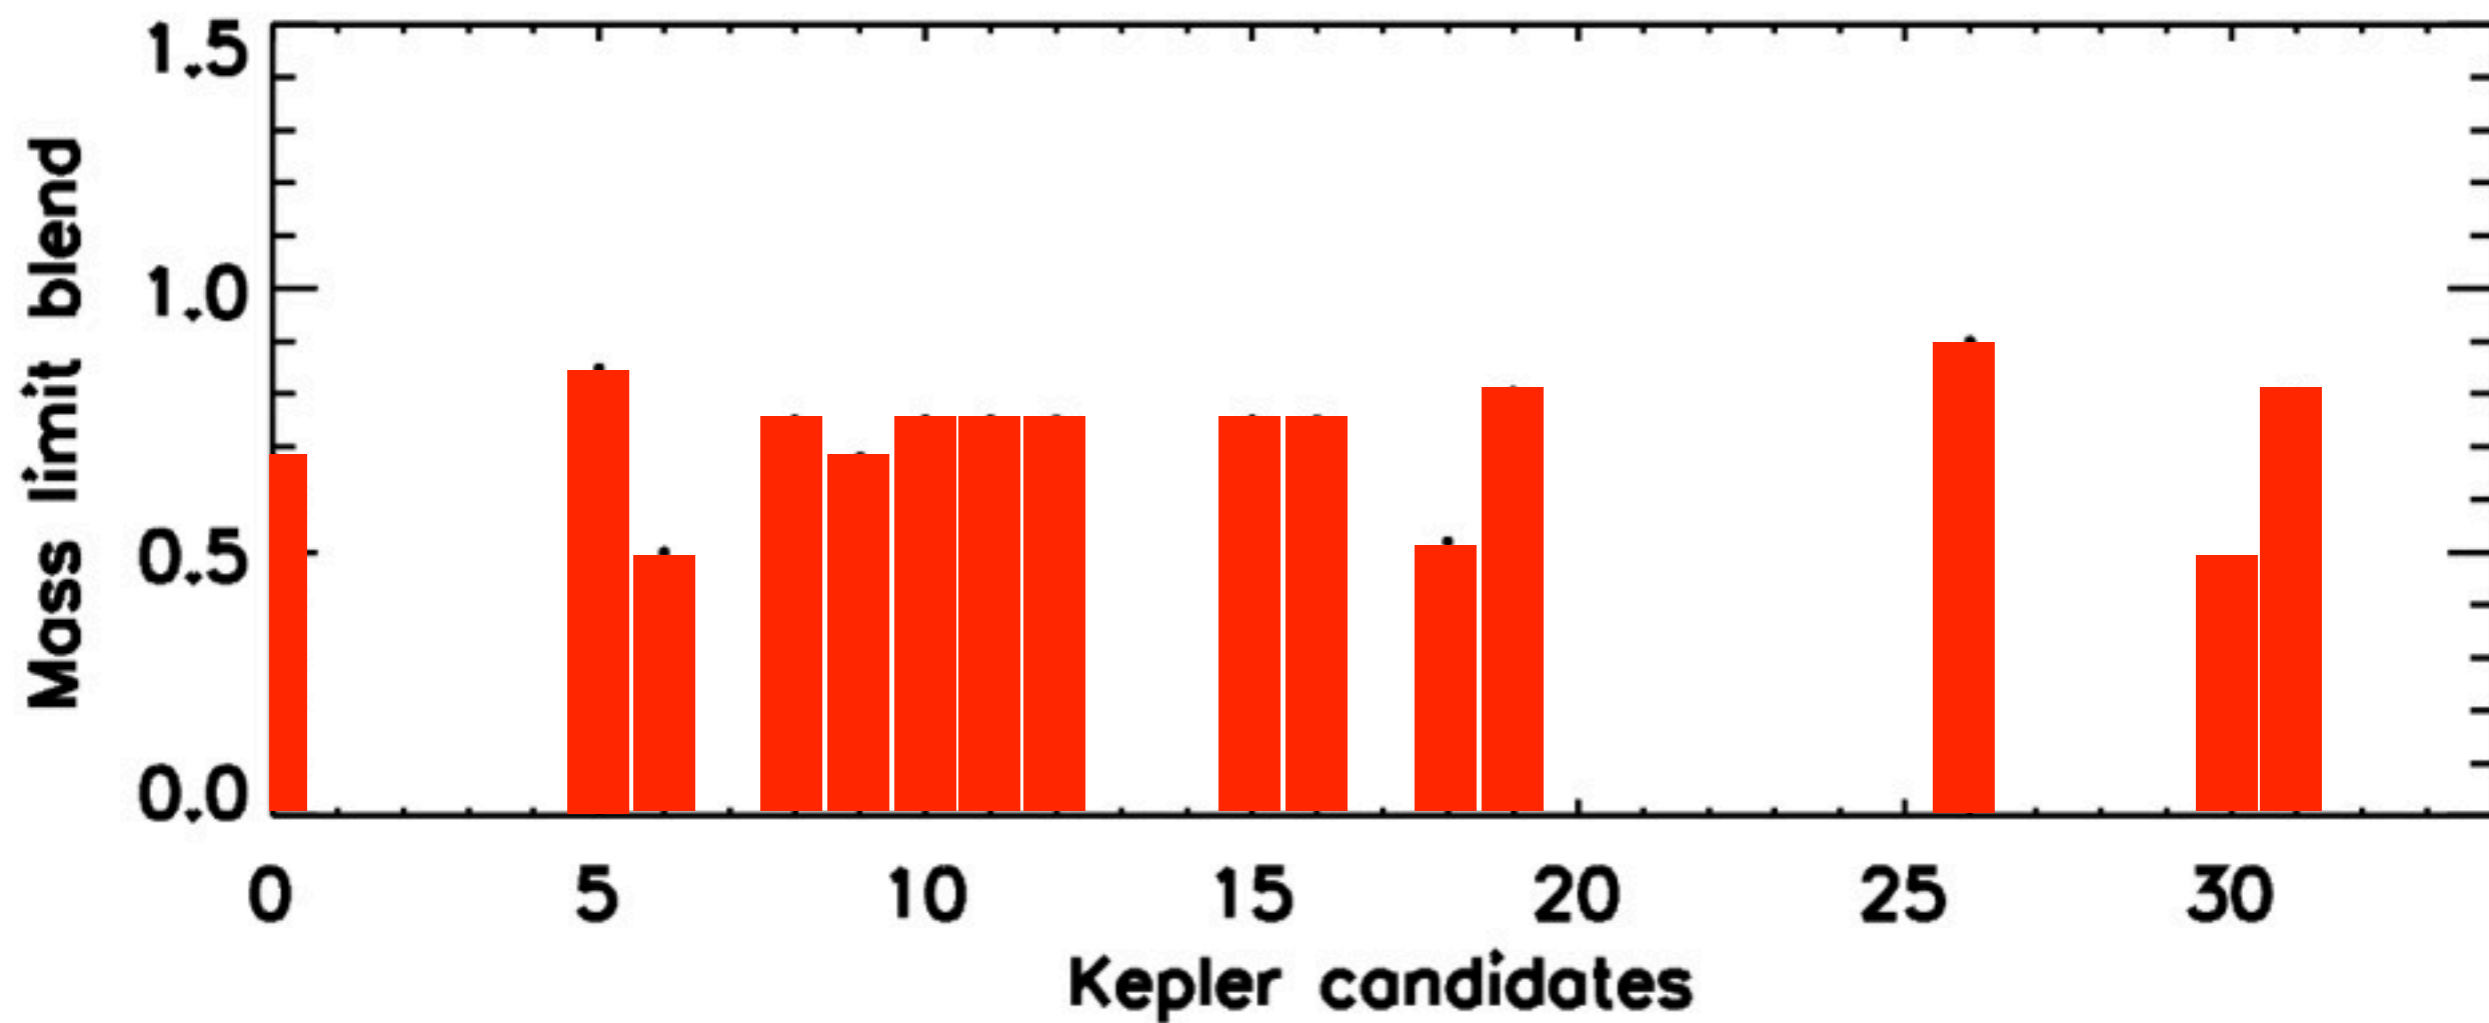

Spitzer depths

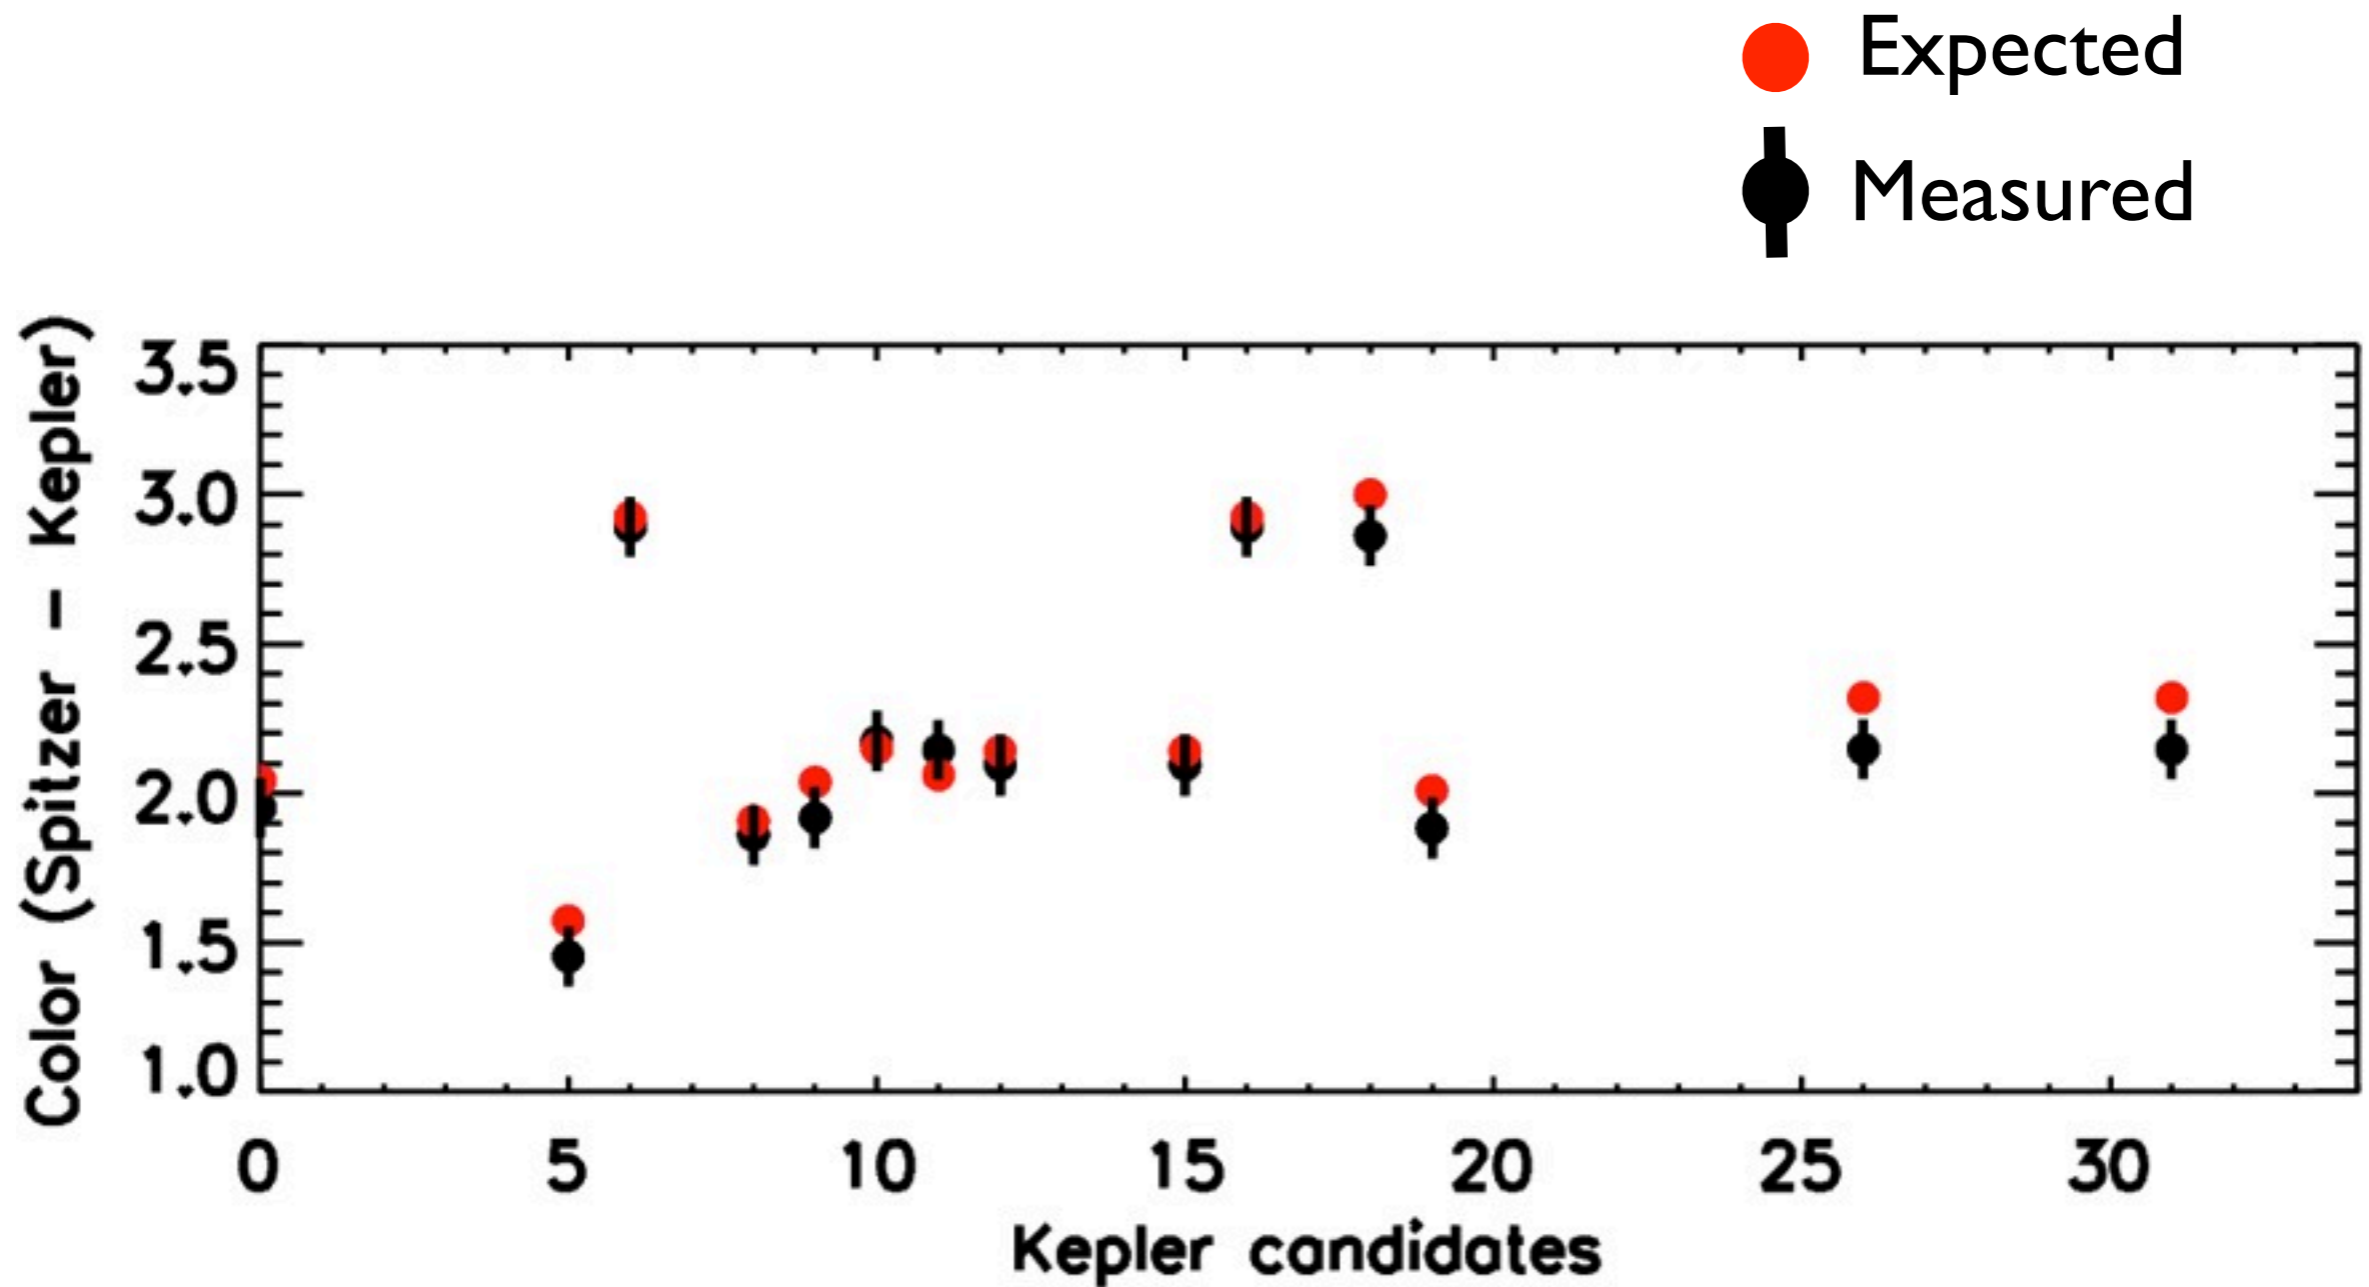

Good stellar characterization

Mass limit secondary (blend)

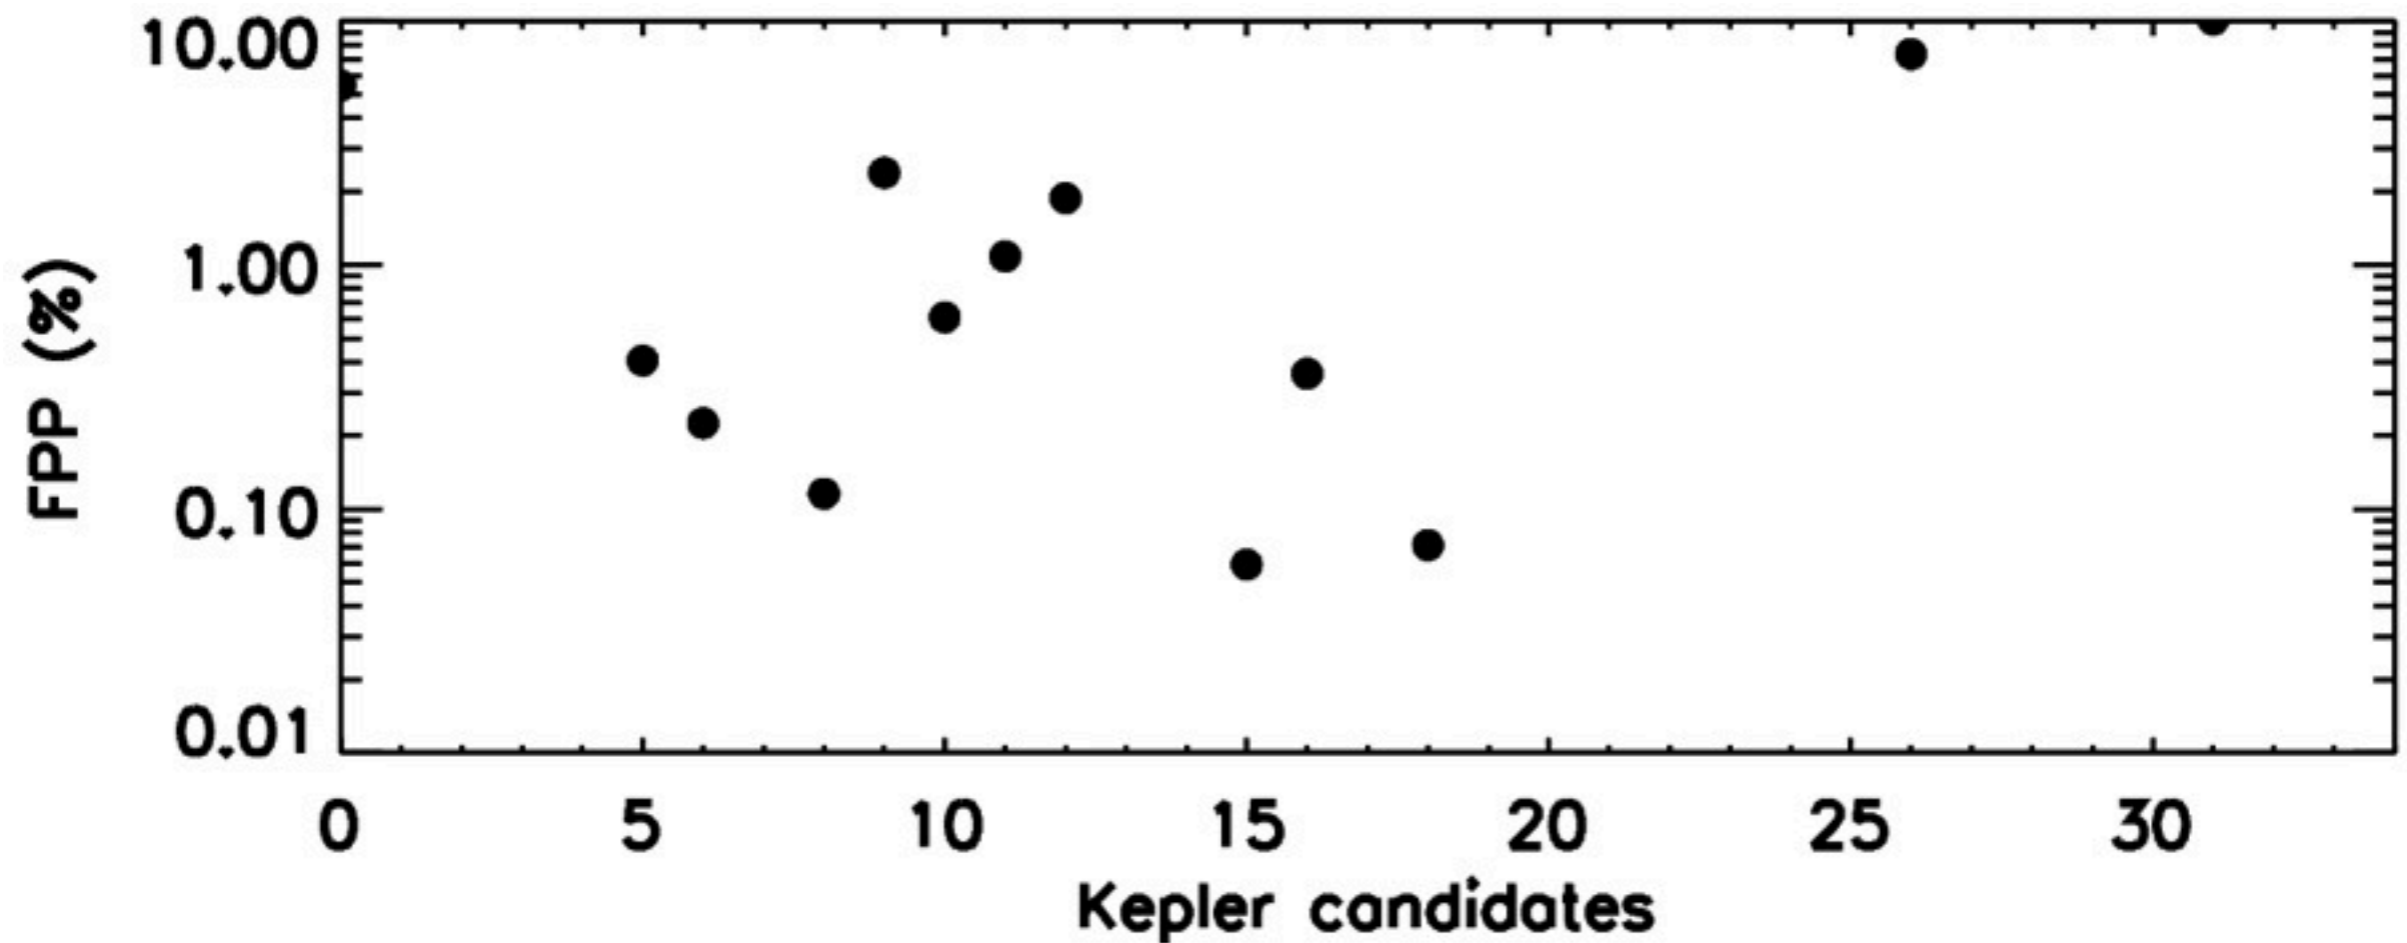

Color (Spitzer - Kepler)

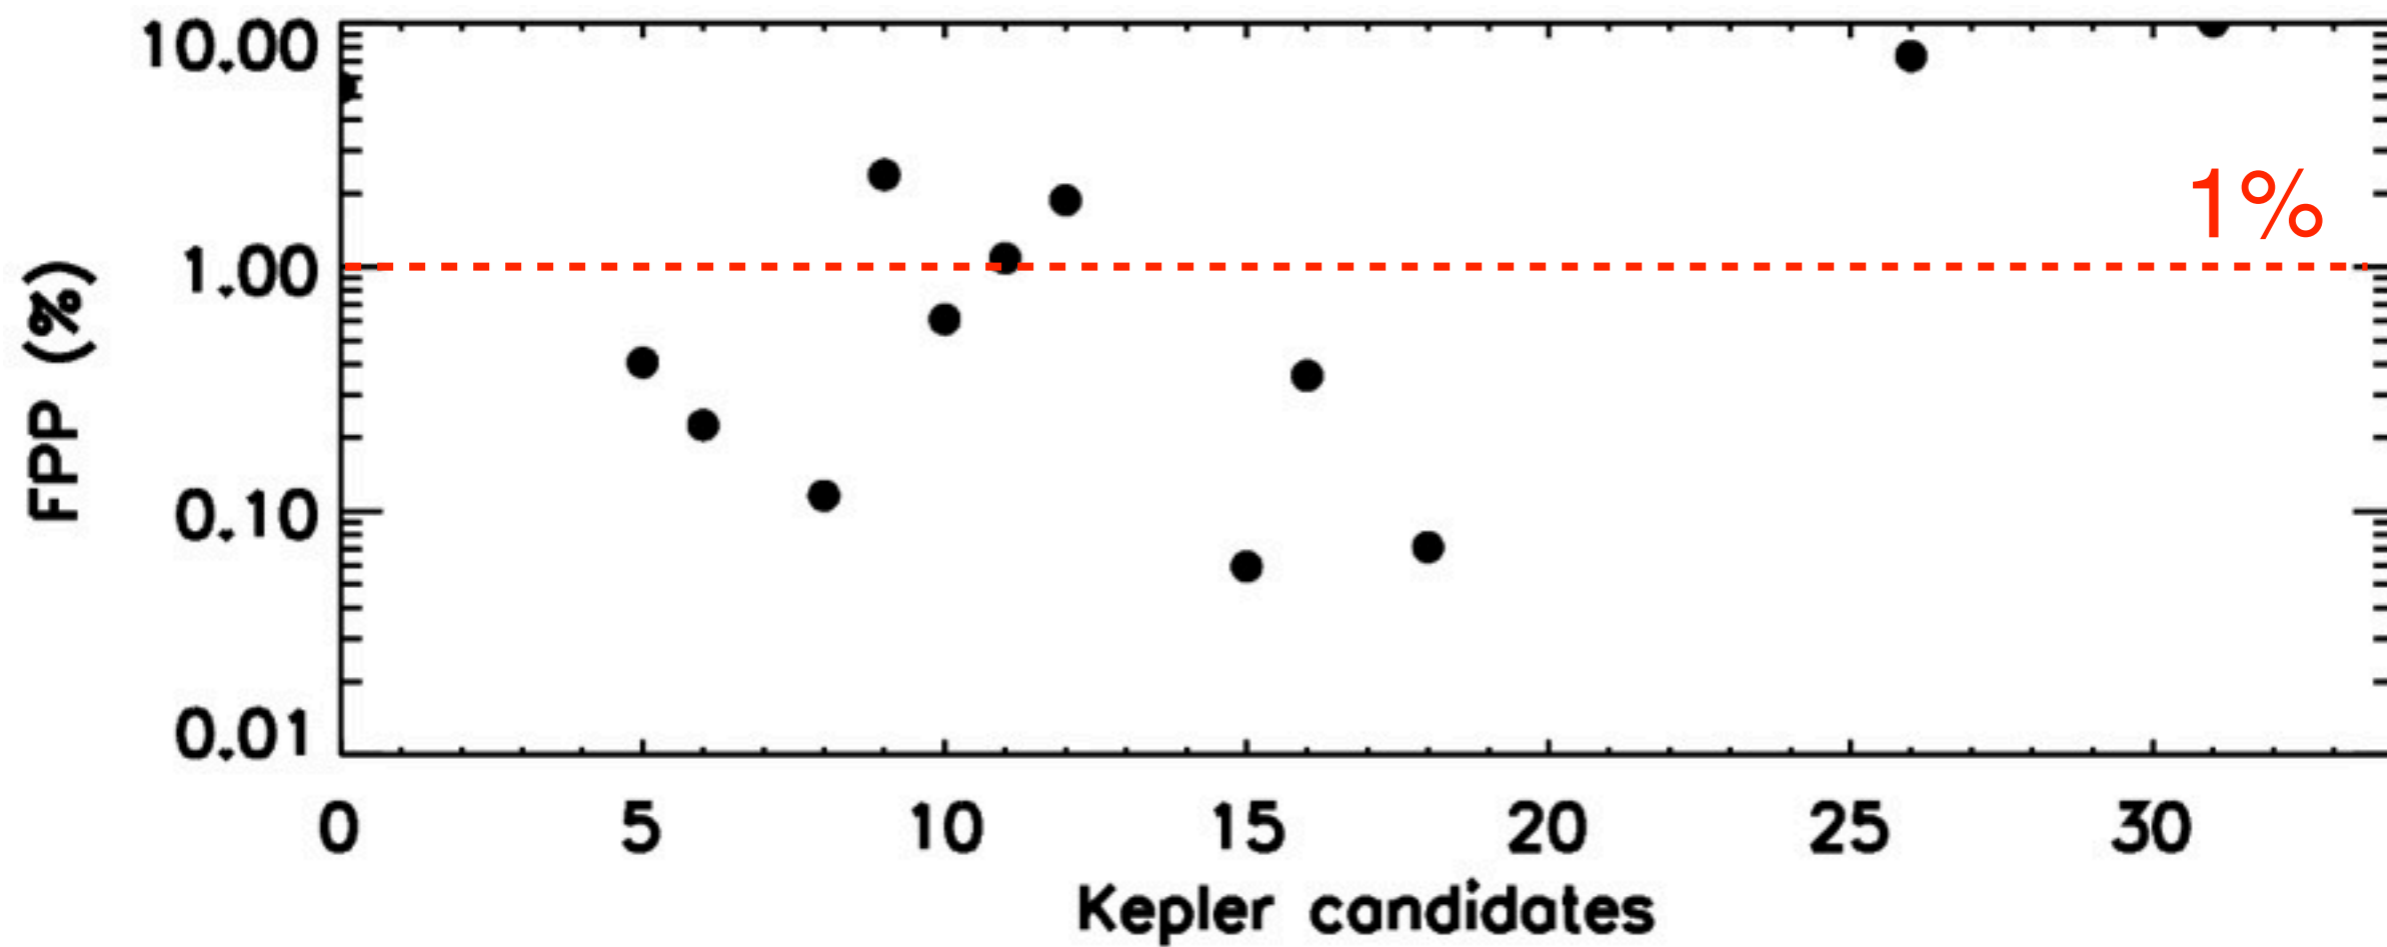

False Positive Probability (FPP)

Spectroscopy, **Spitzer**, AO, Kepler centroid

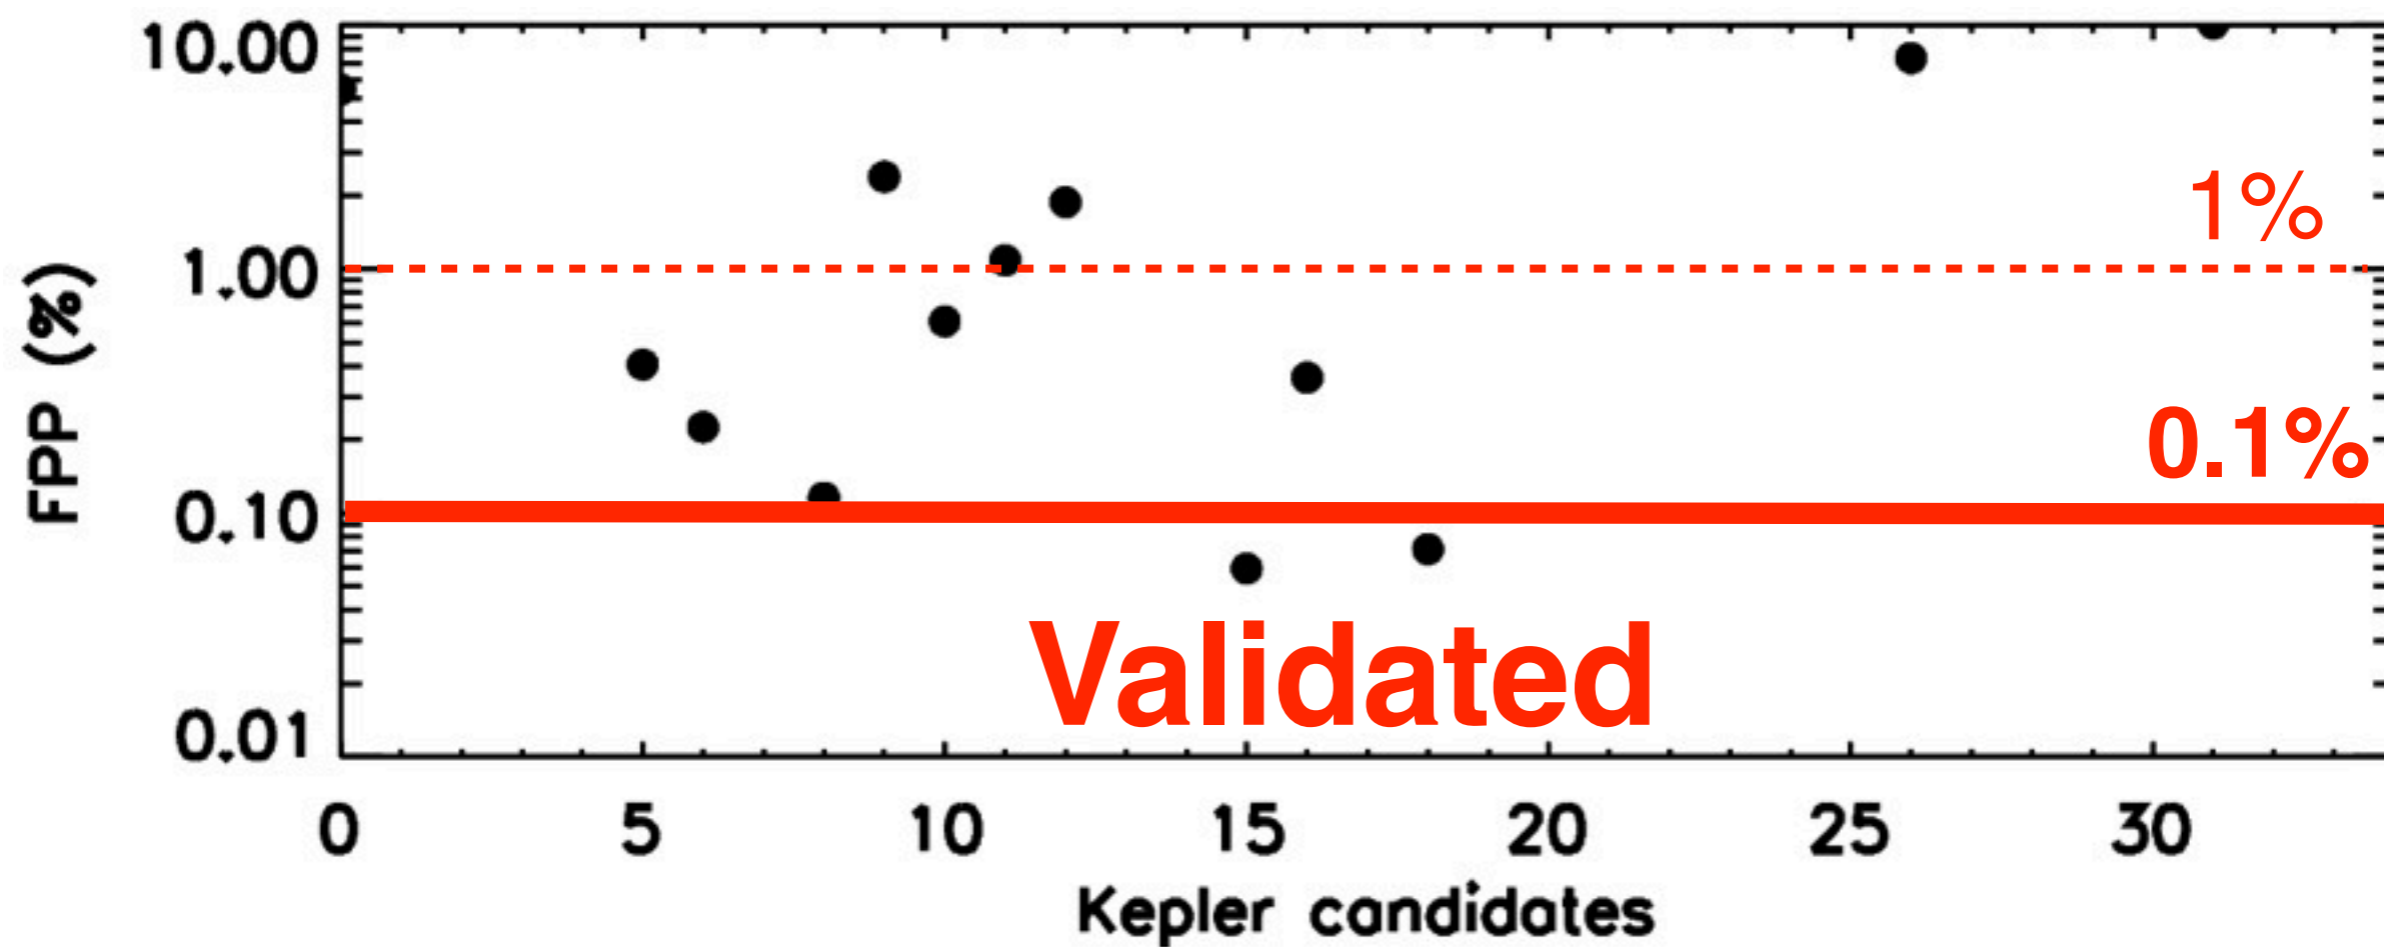

False Positive Probability (FPP)

False Positive Probability (FPP)

False Positive Probability (FPP)

Talk take-home points

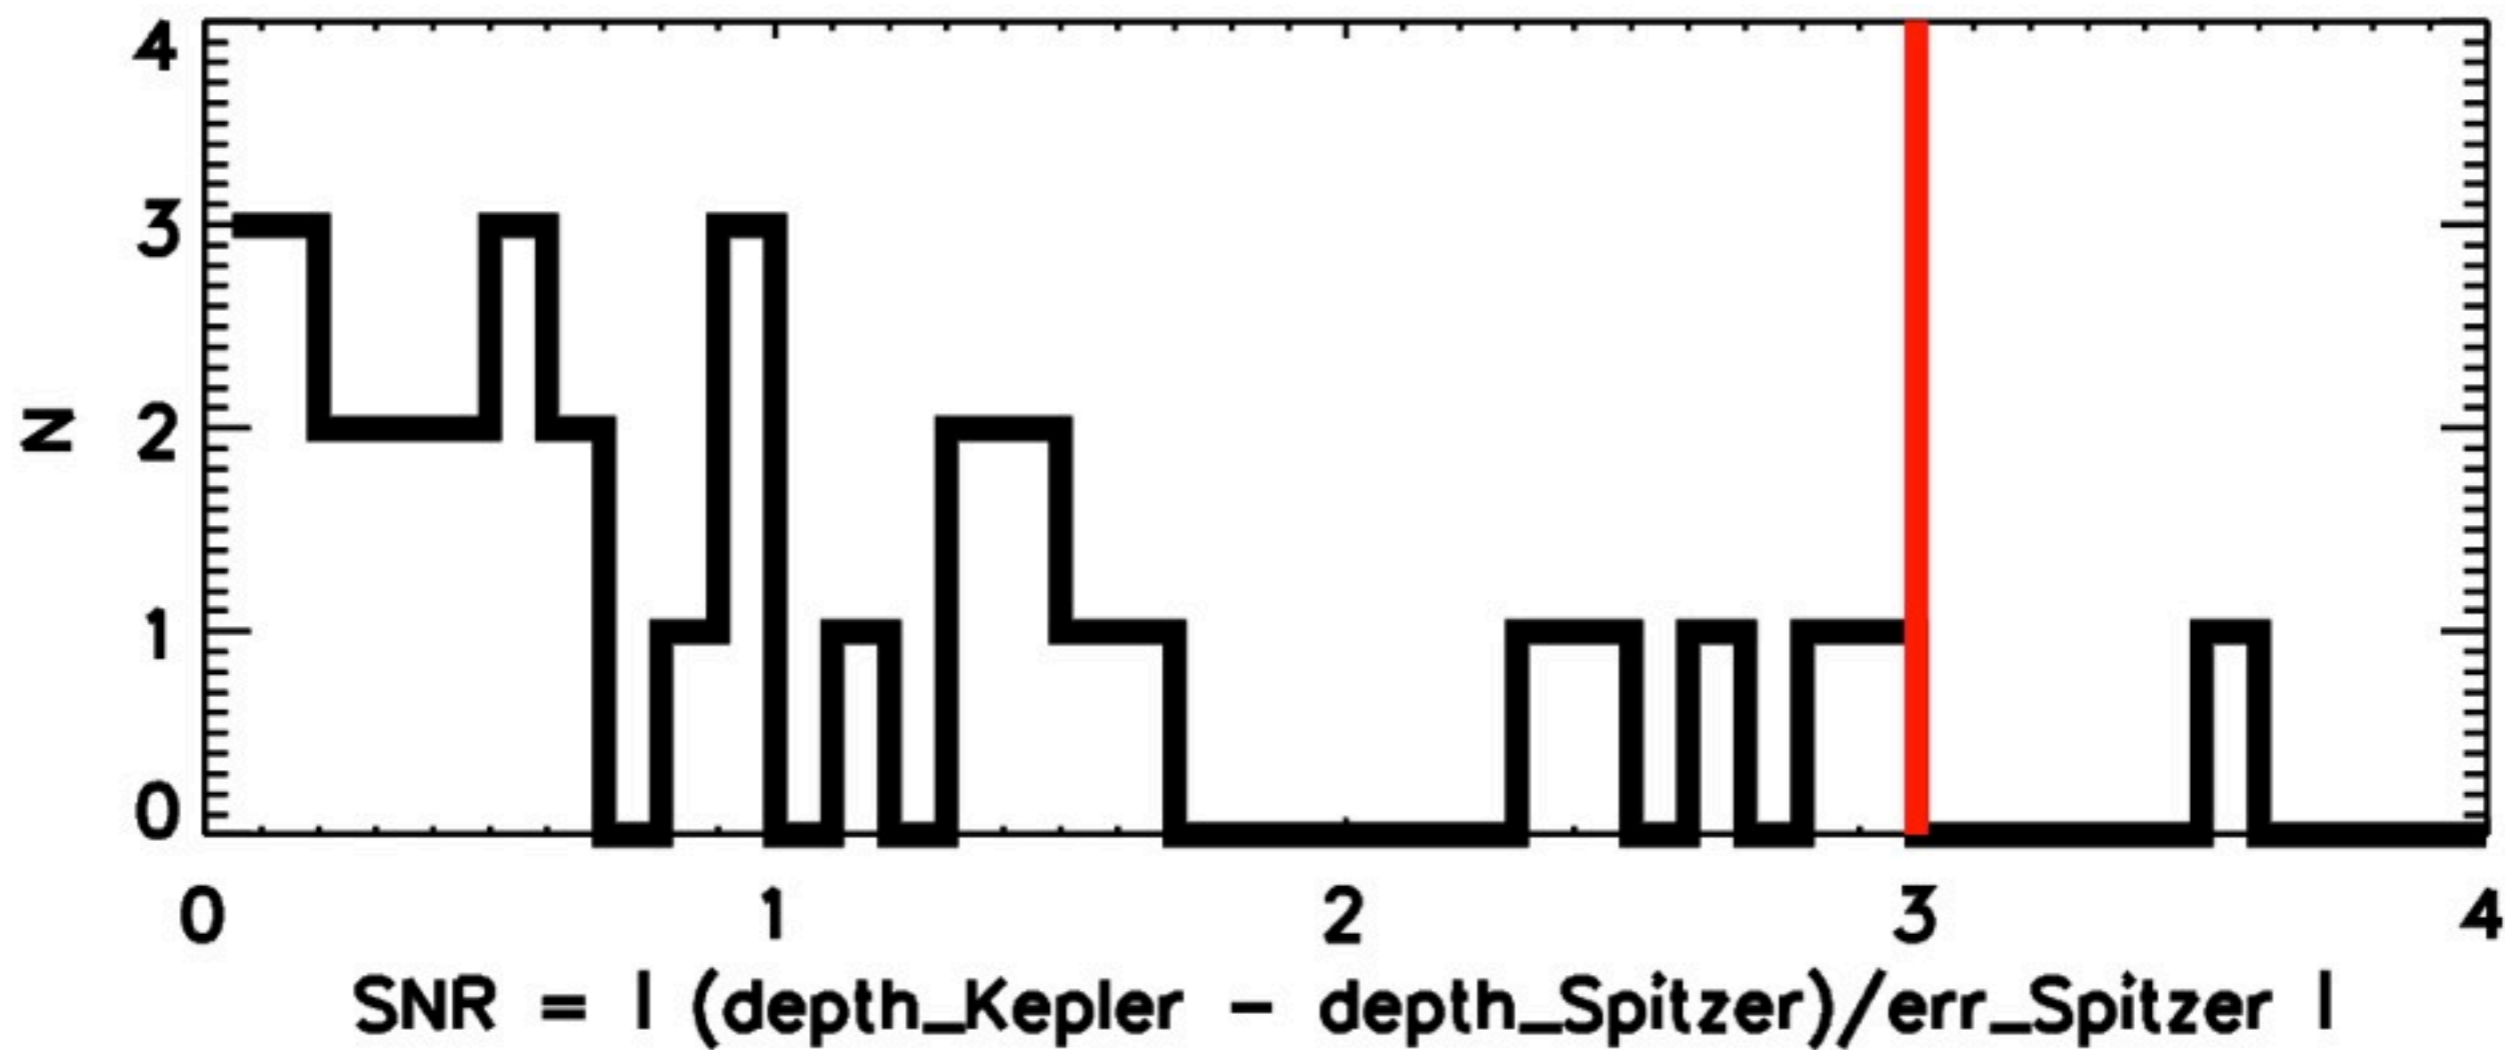

- We use Spitzer NIR transit observations of a sample of Kepler candidates to estimate the **false positive rate**.
- The 34 candidates observed have **all achromatic** transit depths as expected from planetary signals.
- These observations suggest that the false positive rate is low.
